

Ideation Phase

Empathize & Discover

Date	14 July 2026
Team ID	
Project Name	Book a Doctor
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes.

It is a useful tool to help teams better understand their users.

Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Example:

What does he THINK AND FEEL? (Worries, aspirations, major preoccupations)

- "Will I be able to find a specialist who is actually available when I need them?"
- "Is it safe to type my personal medical concerns and history into this platform?"
- "I hope the slot booking is accurate so I don't waste time arriving at the clinic for a canceled session."
- "Healthcare booking should be as simple and instantaneous as ordering food online."

2. What does he HEAR? (What friends, boss, and influencers say)

- **Friends say:** "Don't bother calling the hospital registry; their phone lines are always busy or on hold."
- **Family says:** "Be careful with online medical sites; a lot of them leak personal user account details."
- **Influencers/Tech Blogs say:** "Modern MERN-stack web applications offer highly secure data tracking and responsive dashboards."
- **Co-workers say:** "I exclusively use apps to book appointments now because physical queues take hours."

3. What does he SEE? (Environment, friends, what the market offers)

- Crowded hospital reception desks and chaotic waiting areas.
- Outdated hospital portals that are slow, clunky, and completely broken on mobile phones.

- Friends easily managing other aspects of life (banking, shopping) through streamlined, secure dashboards.
- A market full of apps that either lack proper doctor schedule tracking or feel visually untrustworthy.

4. What does he SAY AND DO? (Attitude in public, behavior towards others)

- **Says:** "I just need a quick, direct way to consult a doctor without spending half my day managing the schedule."
- **Says:** "I won't use an online healthcare system unless it guarantees password encryption and safe authentication."
- **Does:** Searches multiple open web pages trying to compare doctor profiles and check available slots manually.
- **Does:** Gives up on complicated registration forms halfway through if they demand too much unencrypted information.

Pain (Fears, frustrations, obstacles)

- **Fears:** Medical identity theft, unauthorized access to health history, or missing a critical health appointment due to a system bug.
- **Frustrations:** Wasting hours navigating unresponsive user interfaces or sitting in clinics due to overbooked slots.
- **Obstacles:** Lack of transparent, real-time availability tracking for specialist doctors on a single, clean dashboard.

Gain ("Wants" / needs, measures of success)

- **Wants/Needs:** A fully secure dashboard with robust user login, reliable encrypted profiles, and instant slot verification.
- **Measures of Success:** Successfully booking a confirmed doctor's appointment within 2 minutes from a smartphone interface.
- **Comfort:** Feeling absolute peace of mind knowing all personal health data is protected via proper database design and secure REST APIs.
